

Summary Report

To :	Nick Colucci, Director	Date :	July 31, 2020
Town of Erin, Infrastructure Services	Re. :	Monthly Monitoring Report	
From : Andrew Pentney		Groundwater Monitoring Program	
CC : Triton Engineering		Project : Station Street Dam Reconstruction	

The following is a summary report regarding the monitoring completed to date as part of the *Groundwater Monitoring and Mitigation Plan, Reconstruction of Station Street and Replacement of Station Street Bridge (Structure 2064) and Dam Control Structure, Hillsburgh* (May 23, 2019).

Monitoring Locations

As per the monitoring plan the following monitors were installed on April 20, 2020:

- Hillsburgh Pond (stilling well)
- 3 drive-point piezometers at locations around the perimeter of the Pond

The monitoring locations are shown on the attached **Figure 1**, as surveyed by Triton Engineering.

The drive-point piezometers were installed by hand into the shallow sediments along the perimeter of the pond, and allow a comparison of the pond levels to the water table elevations immediately adjacent to the pond at those locations.

Monitor DP1 was deepened on April 30, 2020 in order to intercept the water table.

According to data collected as part of this program, the commencement of construction related pond lowering began on May 12, 2020.

Monitoring Completed

Water level monitoring is completed through occasional manual measurements and on an hourly basis by transducer/dataloggers installed at each location. At most locations water level monitoring began on April 20, 2010. At DP1 water level monitoring began on April 30, 2020. The monitor installation details are provided on the attached **Table 1**. Dataloggers are downloaded every 2nd week, and manual pond level measurements are also obtained weekly.

A hydrograph showing measured water level elevations to date is attached as **Figure 2**. Reported precipitation (rainfall) at the Environment Canada Fergus Shand Dam weather station (closest monitoring station) is additionally plotted on **Figure 2** for comparison purposes.

Water quality samples can be obtained from the Pond, DP1 and DP3. Monitor DP2 is installed in fine grain sediments that do not “produce” sufficient water to obtain representative samples.

Water quality sampling occurred on April 24th and May 4th, prior to construction activities in order to provide baseline data. Samples were also obtained on May 27th, June 9th, June 26th, July 10th and July 22nd (every 2nd week) after construction began.

Water quality sampling results to date are summarized on the attached **Table 2**.

Observations

Groundwater-surface water interaction is summarized as follows:

- Water levels collected to date at DP1 show that the water table along the southeast (downgradient) edge of the pond is significantly lower than the pond (approx. 1.5 m difference), indicating recharge conditions and groundwater flow away from the pond in this location.
- Water levels at DP2 are observed to be higher than the pond level under spring conditions. This indicates groundwater flow toward and into the pond in this area (likely extending along the northwest edge) at that time. Recent water levels indicate that summer evapotranspiration in this area may naturally lower the groundwater table to (or slightly below) the pond level.
- Water levels collected at DP3 indicate that the water table is naturally below the pond level, indicating recharge conditions and groundwater flow away from the pond in this area (likely extending from the creek inflow location to the dam).
- The pond was lowered from mid-May to early June to allow initial construction. A coffer dam was installed in early June, which allowed pond levels to be reestablished. Current pond levels are similar to (however slightly below) pre-construction levels.
- Groundwater levels surrounding the pond responded to the pond level increase in early June (after coffer dam construction). Current groundwater levels are relatively stable and appear to correspond to “natural” conditions in the area of the pond.
- To date water table changes associated with pond lowering are relatively minor. No significant changes in water quality are noted.

Summary

Construction activities have not resulted in any significant changes to groundwater conditions to date. The monitoring schedule includes weekly checks of the pond level and biweekly water level and water quality sampling at the monitoring locations. Monthly reports will also continue to be prepared during construction to update the monitoring results and assess groundwater conditions at, and near, the pond.

Andrew Pentney, P.Geo.
